3. Photoresist is a light-sensitive material applied to semiconductor wafers so that the circuit pattern can be imaged on to the wafer. After application, the coated wafers are baked to remove the solvent in the photoresist mixture and to harden the resist. Here are measurements of photoresist thickness (in kÅ) for eight wafers baked at two different temperatures. Assume that all the runs were made in random order.

2. The shelf life of a carbonated beverage is of interest. Ten bottles are randomly selected and tested, and the following results are obtained:

Da	iys
108	138
124	163
124	159
106	134
115	139

- a. We would like to demonstrate that the mean shelf life exceeds 120 days. Set up appropriate hypotheses for investigating this claim.
- b. Test these hypotheses using α =0.01. What do you conclude on the null hypotheses? Do you accept or reject the null hypotheses?
- c. Construct a 99 percent confidence interval on the mean shelf life.
 [1+4+2 marks]

a) hypotheses

Ho: N= 120

M: U>120

b) Test hypotheses using
$$x = 0.01$$

i of is not known, we will use

t-test

9 = 131

 $S^2 = (108-131)^2 + (124-131)^2 + (106-131)^2$ $+(15-131)^2+(138-130)^2+(163-131)^2+(159-131)^2$ + ((34-(31))² + (139-131)² s² = <u>3438</u> = 382 : S = 19.54 to= <u>y-vo</u> = <u>131-120</u> = 1.78 5/50 19.54/50 : Hi= N > 120 It is a one sided t-test in tage = tong, q

to.01, 9 = 2.281

c) 99.1 considence interval

$$\overline{y}$$
 - t_{42} \overline{y} $\leq w \leq \overline{y} + t_{42}$, \overline{y} \overline{y}

$$131 - (3.520) \left(\frac{10.24}{10.24}\right) \leq n \leq 131 + (3.520) \left(\frac{13.24}{2.20}\right)$$

131-20.08 ENS 131+20.08

110.92 & 25 151.08

Alternatively,

$$131 - 2.281 \left(\frac{19.54}{\sqrt{10}}\right) c w < 13(+ 2.281 \left(\frac{19.54}{\sqrt{10}}\right)$$

116.90 5 w < 145.095

As all on mean shelf life is expected, both onswers are consuct, since, nothing to explicitly mentioned.

3. Front housings for cell phones are manufactured in an injection molding process. The time the part is allowed to cool in the mold before removal is thought to influence the occurrence of a particularly troublesome cosmetic defect, flow lines, in the finished housing. After manufacturing, the housings are inspected visually and assigned a score between 1 and 10 based on their appearance, with 10 corresponding to a perfect part and 1 corresponding to a completely defective part. An experiment was conducted using two cool-down times, 10 and 20 seconds, and 5 housings were evaluated at each level of cool-down time. All 10 observations in this experiment were run in random order. The data are as follows:

10 seconds	20 seconds
1	6
6	8
8	5
2	8
3	7

$$n_1 = n_2 = 5$$

- a. Is there evidence to support the claim that the longer cool-down time results in fewer appearance defects? Use α =0.05.
- b. Find a 95 percent confidence interval on the difference in means. [5+2 marks]

= 4

$$\frac{\hat{y}_2}{\hat{y}_2} = \frac{6+8+5+8+7}{5}$$

4. Answer the following:

a. Develop an equation for finding a $100(1 - \alpha)$ percent confidence interval on the difference in the means of two normal distributions where $\sigma_1^2 \neq \sigma_2^2$. Also, for the distribution state the number of degrees of freedom.

b. Now, for the obtained equation, use the following data and find a 95% confidence interval and calculate the number of degrees of freedom.

	Modified	Unmodified	
	Mortar	Mortar	
1	17	16.75	
2	16.5	16.25	
3	17.25	17.5	

[3+5 marks]

For a two-sided test when
$$\sigma_i^2 \neq \sigma_z^2$$
 for finding confidence interval on difference of means

$$\frac{\left(\overline{9}_{1}-\overline{9}_{2}\right)-\left(\omega_{1}-\omega_{2}\right)}{\int_{\Omega_{1}}^{2}\frac{S_{1}^{2}+S_{2}^{2}}{\Omega_{1}}} \int_{\Omega_{2}}^{2}$$

Now,

$$t_{d/2}, u = \int_{\Omega_1}^{S_1^2} + \frac{S_2^2}{\Omega_1} \le (u_1^2 - u_2^2) - (u_1 - u_2^2) \le t_{d/2} \cdot \frac{S_1^2 + S_2^2}{\Omega_1}$$

$$(\overline{y}_1 - \overline{y}_2) - t_{4/2}, \alpha \sqrt{\frac{S_1^2 + S_2^2}{n_1 n_2}} < u_1 - u_2 < (\overline{y}_1 - \overline{y}_2) + t_{4/2}, \alpha \sqrt{\frac{S_1^2 + S_2^2}{n_1 n_2}}$$

No	of degrees of freedom a,	
	$Q = \left(\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}\right)^2$	
	$\left(\frac{S_1^{2}}{n_1}\right)^2 + \left(\frac{S_2^2}{n_2}\right)^2$	
	$O_1 - 1$ $O_2 - 1$
